

Amendments to the Claims:

The following listing of claims will replace all prior versions and listings of claims in this application.

1-78. (Canceled)

79. (Currently amended) A portable mobile communication and information apparatus in a housing of handheld size and weight, the apparatus comprising:

a cellphone in the housing for being handheld by a person and adapted for placing and receiving person to person telephone calls to and from remotely located telephones, the cellphone having a microphone, a display, a speaker, a camera, and a memory, and a modem all operatively connected in the cellphone, wherein the modem cellphone is operatively connected with the camera and the memory for storing and transmtting images, wherein ~~the cellphone is capable of receiving moving images from the remotely located telephone and storing that which is received from the remotely located telephone to the memory when the cellphone and the remotely located telephone are telephonically connected wirelessly and wherein the cellphone is further adapted for transmitting the stored moving images from the memory or transmitting captured images from the camera to a preselected emergency remote telephone number.~~

80. (Currently amended) The apparatus of claim 79, wherein the cellphone is further adapted for selectively and wirelessly connecting to the Internet for up and downloading moving images and combined sound and moving images.

81. (Currently amended) The apparatus of claim 79 further comprising a sensor in the cellphone housing capable of detecting ~~each~~ any one or a

combination of a sound, motion, and images, wherein the sensor is adapted to cause the cellphone to dial a preselected number upon detecting any one or a combination of the sound, motion, and images.

82. (Previously presented) The apparatus of claim 80 further comprising a speaker adapted for use as a speakerphone.

83. (Previously presented) The apparatus of claim 79, wherein the memory comprises a replaceable memory card having at least one engagement feature.

84. (Previously presented) The apparatus of claim 83 further comprising a socket for receiving the replaceable memory card, the socket comprising an engagement element and a spring, wherein the engagement element mates with the engagement feature of the replaceable memory card and secures the replaceable memory card in the socket and wherein the spring urges the removal of the replaceable memory card from the socket upon releasing the engagement element from the engagement feature.

85. (Previously presented) The apparatus of claim 84 wherein the socket and replaceable memory card are provided with matching non-symmetrical shapes, grooves, ridges, or a combination thereof to facilitate the correct positioning of the replaceable memory card in the socket.

86. (Previously presented) The apparatus of claim 83, wherein the replaceable memory card contains prerecorded data.

87. (Previously presented) The apparatus of claim 86, wherein the prerecorded data comprises any one or more selected from the group consisting of: real-time sounds, music, still images, moving images, textual data, GPS location

information, and combined sounds and moving images.

88. (Previously presented) The apparatus of claim 79 further comprising any one or more of: a video recorder, and a GPS for receiving location information.

89. (Currently amended) The apparatus of claim ~~88-79~~, the camera capable of capturing still and moving images, the display for displaying any one or more of: still images, moving images, images combined with sound through the speaker, and ~~GPS location information~~.

90. (Previously presented) The apparatus of claim 88 further comprising a switch adapted for controlling selective capture of any one or a combination of sounds, images and combined sounds and images.

91. (Previously presented) The apparatus of claim 79 further comprising a radio, wherein sounds and music from the radio is transmitted to at least one of a remote wired earphone or the speaker.

92. (Previously presented) The apparatus of claim 79, the apparatus adapted for muting and interrupting the reproducing of sound from the memory.

93. (Previously presented) The apparatus of claim 79 further comprising an electronic stethoscope connectable to the memory, the apparatus adapted for recording data received from the stethoscope to the memory and for wirelessly transmitting the data from the electronic stethoscope to the Internet or to a remotely located telephone, wherein the electronic stethoscope includes at least one microphone.

94. (Previously presented) The apparatus of claim 79, the apparatus adapted for downloading or transmitting data, including wired or wireless transmission, to at least

an external device.

95. (Previously presented) The apparatus of claim 79, wherein the cellphone is a satellite telephone adapted to connect wirelessly to the Internet and to remotely located telephones.

96. (Previously presented) The apparatus of claim 79 further comprising a sensor in the cellphone housing capable of detecting any one or a combination of sound, motion, and images, wherein the sensor is further adapted to detect any one or more of: low ambient light, light, acceleration, deceleration, smoke, and poisonous gas.

97. (Previously presented) The apparatus of claim 94, wherein the apparatus is adapted for uploading data from the memory and to the Internet or the external device and for downloading data from the Internet or the external device to the memory.

98. (Previously presented) The apparatus of claim 79 further comprising a microprocessor, wherein the microphone is operatively connected to the microprocessor and the memory for recording real-time sounds or music.

99. (Deleted)

100. (Currently amended) A portable mobile entertainment and information apparatus in a housing of handheld size and weight, the apparatus comprising:

a satellite phone in the housing adapted for being handheld by a person and adapted for placing and receiving person to person telephone calls to and from remotely located telephones and selectively and wirelessly connected to the Internet, the satellite phone having a microphone, a display, a speaker, a camera, and a memory ~~and a modem, the modem operatively connected with the memory and~~ wherein the satellite

phone is capable of sending still and moving images to and receiving still and moving images from the remotely located telephone or Internet when the Internet or remotely located telephone is connected and storing images to the memory from the Internet or the remotely located telephone.

101. (Currently amended) The apparatus of claim 100, wherein the satellite phone is adapted for selectively and wirelessly connecting to the Internet and for communicating with remotely located telephones and exchanging data including moving images.

102. (Previously presented) The apparatus of claim 101 further comprising a speaker adapted for use as a speakerphone.

103. (Previously presented) The apparatus of claim 100, wherein the memory comprises a replaceable memory card having at least one engagement feature.

104. (Previously presented) The apparatus of claim 103 further comprising a socket for receiving the replaceable memory card, the socket comprising an engagement element and a spring, wherein the engagement element mates with the engagement feature of the replaceable memory card and secures the replaceable memory card in the socket and wherein the spring urges the removal of the replaceable memory card from the socket upon releasing the engagement element from the engagement feature.

105. (Previously presented) The apparatus of claim 104 wherein the socket and replaceable memory card are provided with matching non-symmetrical shapes, grooves, ridges, or a combination thereof to facilitate the correct positioning of the replaceable memory card in the socket.

106. (Previously presented) The apparatus of claim 103, wherein the replaceable memory card contains prerecorded data.

107. (Previously presented) The apparatus of claim 106, wherein the prerecorded data comprises any one or more selected from the group consisting of:
real-time sounds, music, still images, moving images, textual data, GPS location information, and combined sounds and moving images.

108. (Previously presented) The apparatus of claim 100 further comprising any one or more of a video recorder or a GPS for receiving location information.

109. (Previously presented) The apparatus of claim 108, wherein the display reproduces any one or more of still images, moving images, combined sounds and moving images, or GPS location information.

110. (Cancelled)

111. (Previously presented) The apparatus of claim 100 further comprising a radio, the apparatus adapted for interrupting wherein the sounds and music from the radio is transmitted to at least one of the remote wired earphone, and the speaker and for interrupting the playing of sounds, music or combined sounds and images from the memory or the Internet when receiving a telephone call.

112. (Previously presented) The apparatus of claim 100, the apparatus adapted for muting and interrupting reproducing of sound and music from the memory.

113. (Previously presented) The apparatus of claim 100 further comprising an electronic stethoscope connectable to the first or second jacks, the apparatus adapted for recording data received from the stethoscope to the memory, and the apparatus adapted for wirelessly transmitting the data from the electronic stethoscope to the

Internet or to a remotely located telephone, wherein the electronic stethoscope includes at least one microphone.

114. (Previously presented) The apparatus of claim 101, the apparatus adapted for downloading or transmitting data, including wired or wireless transmission, to an external device.

115. (Cancelled)

116. (Previously presented) The apparatus of claim 100 further comprising a sensor in the satellite phone housing capable of detecting each one or a combination of a sound, motion, and images, wherein the sensor is further adapted to detect each one or more of: low ambient light, light, acceleration, deceleration, smoke, and poisonous gas.

117. (Previously presented) The apparatus of claim 114, wherein the apparatus is adapted for uploading data to and downloading data from the Internet or the external device.

118. (Previously presented) The apparatus of claim 100 further comprising a microprocessor, wherein the microphone is operatively connected to the microprocessor and the memory for recording real-time sounds or music.

119. (Previously presented) The apparatus of claim 100 adapted for remote activation for the microphone or the camera.

120. (Previously presented) A portable information and communication apparatus in a housing, comprising:

a cellphone in the housing including a microphone, a camera and a GPS unit capable of generating data, the cellphone adapted for wirelessly connecting with a

communication network and including a preselected address for transmitting the generated data;

a memory;

wherein the cellphone is adapted-for recording generated data to the memory and adapted for transmitting generated data to the preselected address when activated by preselected external stimuli received by the cellphone;

a sensor in the housing adapted to activate the microphone or the camera.

121. (Previously presented) The apparatus of claim 120 the communication network being one of the Internet, a cellular network or a satellite network.

122. (Previously presented) The apparatus of claim 121, the cellphone further including a mode with no ring tone for receiving a call and being responsive to a command to transmit the generated data to the preselected address.

123.-126. (Canceled)

127. (Previously presented) The apparatus of claim 120, the cellphone further including a display for displaying at least one of still images, moving images, combined sounds and moving images, or GPS location information.

128.-130. (Canceled)

131. (Previously presented) The apparatus of claim 120 further comprising a jack, an electronic stethoscope connectable to the jack, the apparatus adapted for recording data received from the stethoscope to the memory, and for wirelessly transmitting the data from the electronic stethoscope to the communication network, wherein the electronic stethoscope includes at least one microphone.

132.-133. (Canceled)

134. (Previously presented) The apparatus of claim 120, the cellphone detecting any one or more external stimuli selected from the group consisting of: low ambient light, motion, sound, light, image, acceleration, deceleration, smoke, and poisonous gas.

135. (Canceled)

136. (Previously presented) The apparatus of claim 137, the remote activation wirelessly connecting with the cellphone through the communication network.

137. (Previously presented) The apparatus of claim 120, the cellphone further adapted for remote activation for the microphone or the camera.

138. (Previously presented) An apparatus in a housing for an electronic device, the apparatus comprising:

- a small replaceable flash memory card, the flash memory card having at least one engagement feature without an elastic member or movable element, the flash memory card not being a pre-paid phone card, ATM card, SIM card or network connecting card;

- a socket in the housing for the flash memory card, the flash memory card being directly received in the socket without a separate card case or a separate card carrier;

- an internal engagement element in the socket selectively engageable with the at least one engagement feature of the card for retaining the card fully within the socket;

- a spring disposed internally in the socket facilitating the removal of the card from the socket by spring power automatically upon release of the internal engagement element in the socket from the at least one engagement feature of the flash memory card;

the flash memory card and the socket being asymmetrically shaped for preventing incorrect insertion of the card in the socket;

the flash memory card being operatively connected to the electronic device for storing data when fully positioned in the socket.

139-143. (Canceled)

144. (Previously presented) The apparatus of claim 138, the engagement feature of the memory card being at least one hole for engagement in the socket.

145.-148 (Canceled)

149. (Currently amended) A mobile entertainment, information and communication apparatus comprising:

a cellphone or satellite phone having a portable housing of size and weight for being handheld by a person, a microphone, a display, a speaker, a microprocessor, a memory, ~~a modem~~ and at least one of a camera, a GPS or a jack, the cellphone or satellite phone adapted for placing and receiving person to person telephone calls to and from remotely located telephones and selectively connecting the Internet wirelessly, the microprocessor selectively storing at least one of sounds, still or moving images, combined sounds and moving images or GPS location information to the memory from at least one of the microphone, GPS, camera or Internet;

the cellphone or satellite phone adapted for selectively transmitting stored sounds, still or moving images, combined sounds and real time moving images or GPS location information with or without images to at least one of the Internet , remotely located telephone or separate computer from the memory, the microprocessor operatively connected to the ~~modem and the~~ memory; and

the display and speaker adapted for reproducing stored sounds and images from the memory or from the Internet when the Internet is connected wirelessly.

150.-155. (Canceled)

156. (Previously presented) A portable information and communication apparatus in a housing, comprising:

a cellphone in the housing including a microprocessor, a memory comprising a built-in memory and a replaceable memory card, a socket receiving the memory card, a display, a microphone, a GPS, a sensor for capturing external stimuli, and a camera;

wherein the microprocessor is operatively connected to the memory and is adapted to selectively control the capture of data, storage of the data to the memory, and transmission of data;

wherein the cellphone is adapted for storing sound, moving images and combined sound and moving images to the memory and for reproducing the sound, moving images and combined sound and moving images from the memory to at least one of a computer or a television;

wherein the data includes any one or more selected from the group consisting of real time sounds, still images, moving images, music, music with images, combined sounds and moving images, combined sounds with images and text, and GPS location information;

wherein the microprocessor is activated by preselected external stimuli received by the sensor to transmit the data by the cellphone.

157. (Previously presented) A digital camera comprising:

a palm-sized housing that fits in the hand;

a camera for capturing still or moving images;

at least one of (1) a microphone, (2) a wired microphone, or (3) a GPS;

at least one of (1) a wired or wireless earphone, (2) a built-in speaker, or (3) a display, a jack for a wired connector to a computer or television;

the digital camera having a replaceable flash memory card for storing data captured by at least one of the (1) camera, (2) microphone, (3) wired microphone, or (4) GPS and reproducing the stored data by at least one of the (1) wired or wireless earphone, (2) speaker, (3) display, (4) computer, or (5) television, the memory card comprising at least one engagement feature without any elastic member or element on the card, the memory card having an asymmetrically shaped corner;

wherein the data comprises any one or more of the following: sounds, real-time moving images, combined sounds and images simultaneously, combined text and sounds, still images, and GPS location information, with or without images;

a socket in the housing for directly receiving the memory card without a separate card adapter case or card locking elastic member on the housing, the socket comprising an internal engagement element and a spring disposed internally in the socket, wherein the engagement element of the socket mates with the engagement feature of the memory card when the memory card is fully inserted in the socket and secures the memory card in the socket and wherein the spring facilitates the removal of the memory card from the socket by spring power upon releasing the internal engagement element of the socket from the engagement feature of the memory card;

the socket is asymmetrically shaped for preventing wrong insertion of the memory card;

wherein the socket is adapted for selectively receiving the flash memory card,
and not a prepaid phone card, SIM card, ATM card, or network connecting card;

wherein the socket and the memory card are operatively connected to a
microprocessor and at least one of a microphone, a remote microphone, an earphone, a
display, a camera, a GPS or a jack and the microprocessor adapted for at least one of
capturing, recording, reproducing or transferring data to and from the memory card.

158. (Previously presented) The device of claim 157 wherein the socket and
the replacement memory card are asymmetrically shaped to match and to facilitate the
correct positioning of the replaceable memory card in the socket and the memory card
engagement feature being a hole for securing and removing the card.

159. (Currently amended) A portable mobile entertainment and information
apparatus in a housing of palm handheld size and weight, the apparatus comprising:

a device in the housing adapted for wireless connection to the Internet and for
uploading and downloading of data between the Internet and an internal memory;

the data comprising at least one of music with or without images, moving images,
sounds, combined sounds and moving images or GPS location information;

a microprocessor adapted to control the storing, reproducing, uploading and
downloading of data, wherein the microprocessor is operatively connected to a display;

at least one button operatively connected to the microprocessor and adapted to
control at least one of starting the playing, equalizing sounds, skipping data or balancing
sounds, and of said reproducing data from the internal memory or the Internet;

a remote earphone for reproducing data from the internal memory or the Internet;
a jack provided for connecting the apparatus to a separate device for transferring data

to and from the internal memory, wherein the microprocessor is operatively connected to the internal memory and the jack; and

a sensor in the housing adapted for detecting ~~each~~any one or a combination of: low ambient light, acceleration or deceleration.

160. (Previously presented) The apparatus of claim 159, wherein the memory comprises a replaceable memory card having at least one engagement feature, and a socket for receiving the memory card, the socket having a spring and an engagement element in the socket for securing memory card in the socket or removing the memory card from the socket.

161. (Previously presented) The apparatus of claim 159, wherein the device comprises a cellphone adapted for selectively and wirelessly connecting to the Internet and for communicating with remotely located telephones.

162. (Previously presented) The apparatus of claim 79, the apparatus recording audio data received from a microphone to the memory, wherein the audio data is any one or more selected from the group consisting of real-time sounds and music.

163. (Previously presented) The apparatus of claim 79, wherein the microphone is selected from the group consisting of: a built-in microphone and a remote-wired microphone.

164. (Previously presented) The apparatus of claim 79, wherein the memory is a built-in memory.

165. (Previously presented) The apparatus of claim 100, wherein the images are still images.

166. (Previously presented) The apparatus of claim 100, wherein the images

are real-time moving images.

167. (Previously presented) The apparatus of claim 100, wherein the microphone is a built-in microphone.

168. (Previously presented) The apparatus of claim 100, wherein the microphone is a remote-wired microphone.

169. (Previously presented) The apparatus of claim 100, the satellite phone adapted to operatively connect the memory to an external device and wherein the external device is selected from the group consisting of: a computer and a television.

170. (Previously presented) The apparatus of claim 157, wherein the device comprises a cellphone and/or satellite phone adapted for selectively and wirelessly connecting to the Internet and for communicating with remotely located telephones.
